

# Advanced C Programming

## Module II

### Strings and Pointers :

Strings and pointers in C are very closely related. Since a string is an array, the name of the string is a constant pointer to the string. This pointer can be used to perform operations on the string.

Declaration: `char *pointer;`

Example: `char *ptr;`

Initialization:

Before use, every pointer must be initialized. To initialize a pointer, we assign it the address of a string.

Syntax: `pointer = stringname;`

Example:

```
char str[20] = "Hello";
```

```
char *ptr;
```

```
ptr = str;
```

Using the pointer, string characters can be accessed and modified. Each character can be accessed using **\*ptr**. For example, to display all characters using pointer, the following loop can be used.

```

char str[20] = "Hello";
char *ptr;
for (ptr = str; *ptr != '\0'; ptr++)
{
    putchar(*ptr);
}

```

### Accessing string using pointer program:

```

#include <stdio.h>
int main (void)
{
    char str[6] = "Hello"; // string variable
}

```

```
char *ptr = str; // pointer variable
```

```
while (*ptr != '\0')
```

```
{
```

```
    printf("%c", *ptr); // print the string
```

```
    ptr++; // move the ptr pointer to the next memory location
```

```
}
```

```
return 0;
```

```
}
```

Output:

Hello

Using pointer to store string:

```
#include <stdio.h>
```

```
int main(void)
```

```
{
```

```
char *strptr = "Hello"; // pointer variable to store string
```

```
char *t = strptr; // temporary pointer variable
```

```
while (*t != '\0')
```

```
{
```

```
    printf("%c", *t); // print the string
```

```
    t++; // move the t pointer to the next memory location
```

```
}
```

return 0;

}

Output :

Hello

char \*strptr = "Hello";
